AUTHOR: Slepov, B. I. (Leningrad)

TITLE: Vibrations and stability of an elliptical shell

SOURCE: AN SSSR. Izv. Mekhanika i mashinostroyeniye, no. 3, 1964, 144-146

TOPIC TAGS: shell, elliptical shell, anisotropic shell, shell stability, shell flexural vibration, critical pressure calculation, frequency square calculation, Bubnov Galerkin method

ABSTRACT: The article presents approximate calculations of the frequency of free flexural vibrations for an elliptical anisotropic shell and calculations of the stability of such shells when acted on by normal and uniformly distributed pressure. The problem is reduced to integration of the equation

$$\begin{aligned} \nabla_1^4 \left\{ p \left[\nabla_2^4 w - q \left(\frac{\xi (\xi_0 - \xi)}{2} \frac{\partial^2 w}{\partial \xi^2} \frac{d^2 p}{d \eta^2} + (2\xi - \xi_0) \frac{\partial^2 w}{\partial \xi \partial \eta} \frac{d p}{d \eta} - \right. \right. \right. \\ \left. \left. - \frac{\pi a b}{s_0 r_0} \frac{\partial^2 w}{\partial \xi^2} - p \frac{\partial^2 w}{\partial \eta^2} \right) + \frac{p_{H_1} s^4}{D_1} \frac{\partial^2 w}{\partial \eta^2} \right] + \frac{4 b_1^4}{p} \frac{\partial^4 w}{\partial \xi^4} = 0 \right. \\ \left. \nabla_1^4 = E_1 \frac{\partial^4}{\partial x^4} + E_4 \frac{\partial^4}{\partial x^2 \partial s^2} + E_3 \frac{\partial^4}{\partial s^4}, \quad E_4 = \frac{E_1 E_2}{G} - E_1 \mu_4 - E_4 \mu_1 \right. \\ \left. p = \frac{r}{r_0}, \quad \xi = \frac{x}{r_0}, \quad \eta = \frac{s}{r_0}, \quad \xi_0 = \frac{L}{r_0} \right. \end{aligned} \quad (1)$$

AUTHOR: Slepov, B. I. (Leningrad)

TITLE: Vibrations and stability of anisotropic and three-layer cylindrical shells of arbitrary cross section

SOURCE: Vsesoyuznaya konferentsiya po teorii obolochek i plastin. 4th, Yerevan, 1962. Teoriya obolochek i plastin (Theory of plates and films); trudy* konferentsii, 1964, 894-903

TOPIC TAGS: shell, anisotropic shell, elliptical cylinder, hydrostatic pressure, cylindrical shell, sandwich shell, three layer shell, shell stability, shell vibration

ABSTRACT: All studies to date on the vibrations and stability of single-layer anisotropic and three-layer cylindrical shells consider only shells of circular cross section. The question of the vibrations and stability of shells having the form of a cylinder of arbitrary cross section has not been investigated, despite the desirability of the development of a methodology for such computations. An approximate solution of this problem can be achieved with relative ease on the basis of the determination of the initial stress state of such shells by means of the momentless theory. In this report, the author uses the Bubnov-Galerkin approach to the problem of the free bending oscillations and stability of a single-layer anisotropic shell, having the form of an elliptical cylinder freely supported at the end sections and

Card 1/3

ACCESSION NR: AT4039442

under the load of a uniformly distributed hydrostatic pressure. An analogous problem is also considered for a three-layer elliptical shell with rigid incompressible filler. The solution of both problems is presented in a linear formulation and the approximate solutions derived have been reduced to relatively simple calculation formulas for the frequency of the bending oscillations and the critical pressure. There is no particular need to obtain the so-called lower critical pressure, since, in the given problem, this differs from the upper, as obtained in the linear formulation, by a maximum of $\sim 30\%$. In the first part of the article (single-layer anisotropic elliptical shell), the point of departure is a system of equations for the movement of a cylindrical shell of arbitrary cross section in which the tangential inertial forces have been disregarded and only the forces of inertia from the normal bending are considered. The initial stress of the shell is assumed to be without moment, while the corresponding forces are defined according to the expressions derived in the work of V. V. Novozhilov. (V. V. Novozhilov. Teoriya tonkikh obolochek. Sudpromgiz, 1951). In the second part of the paper (three-layer elliptical shell with rigid incompressible filler), situation, results for the case of a light filler can be derived from the results obtained for a rigid filler by disregarding the tensile and flexional strength factors of the filler. The particular problem considered concerns a rigid filler whose transverse strain may be disregarded. The problem is solved

Card 2/3

ACCESSION NR: AT4039442

in a linear formulation using the theory of sloping shells. The conventional suppositions are made: (a) the material of the lifting layers is homogeneous and isotropic; (b) the arrangement of the lifting layers is symmetrical with respect to the center surface of the shell; (c) the Poisson coefficients of the lifting layers and the filler are identical; (d) for the lifting layers the Kirchhoff-Lyav hypotheses are applicable; (e) the straight-line hypothesis is used for the filler. Orig. art. has: 1 table and 20 formulas.

Ed.: Barskov, I., and Novozhilov, K.; Tech. Ed.: Troyanovskaya, N.

PURPOSE: This book is intended for construction engineers and technical personnel in the construction industry.

COVERAGE: The author discusses the adoption of industrial methods in the construction industry of the Soviet Union, and lists various conditions which are necessary prerequisites, such as developing a large scale building-industry, the overall mechanization of operations, and the enlarging and specializing of present construction organizations. The author states that it will be necessary to improve the qualifications of the personnel and increase the role played by engineers and technical personnel in the construction industry. No personalities are mentioned. There are no references.

 SOURCE: Izobreteniya, promyshlennyye obraztsy, tovarnyye znaki, no. 3, 1966, 105-106
 TOPIC TAGS: ball bearing, antifriction bearing 7
 ABSTRACT: This Author Certificate presents a ball bearing for axial motion, consisting of a body with a closed channel which is filled with balls. To increase accuracy and reliability of the connection, the bearing body is constructed of several sections connected by a fixture. The sections fit into openings in the latter and interact with its bearing surfaces through inserts (see Fig. 1). To prevent the balls from falling out when the shaft is removed, an additional feature provides each section with two limiting plates which have inclined edges directed toward the balls. 2

TITLE: Peculiarities of one class of apparatus for thermochemical heterogeneous processes as an object of automatic control

SOURCE: Moscow. Gosudarstvennyy institut tsvetnykh metallov. Sbornik nauchnykh trudov, no. 21, 1964. Matematicheskiye modeli tekhnologicheskikh protsessov i razrabotka sistem avtomaticheskogo regulirovaniya s peremennoy strukturoy (Mathematical models of technological processes and development of variable structure feedback systems), 195-206

TOPIC TAGS: automatic controls, thermochemical process, heterogeneous process, mathematical model

ABSTRACT: The authors propose a general differential equation, as well as differential equations for two particular cases, which reflect the dynamic peculiarities of the different technological modes or conditions of one class of apparatus for thermochemical heterogeneous processes, considered as objects of automatic control. An understanding of this article requires some degree of familiarity with the preceding articles of this series (pp. 84, 142, 166), in which

Card 1/2

L 15023-65

ACCESSION NR: AT4047298

the structural arrangement and describing system of differential equations are given for the mathematical models of a large number of heterogeneous processes in the chemical, metallurgical and other branches of industry. In the present article, for the purpose of investigating the properties of this class of technological apparatus as the object of automatic control, the system of equations developed in the preceding papers is reduced to a single equation. Without detracting from the generality of the study, the authors consider the regulating effect to be the change in the solid phase flow reaching the apparatus. It is shown that, for a number of technological conditions or modes, the class of objects considered in the article is, in effect, a non-linear element which does not permit linearization. Orig. art. has: 2 figures and 28 formulae.

Orig Pub: Ind. lemn. celul. si hirt., 1956, 5, No 3, 142-144.

Abstract: The Role of fillers (F) in the production of paper (P) and their effect upon the properties of P are considered. In certain grades of P no F are allowed, as the P must have ash content. Depending upon their ash content, P's are divided into four groups: 1) condensed P, electrical insulation P, filter P (1%), 2) cigarette P, asphaltting P (5%), 3) printing P and stationery (15%) and 4) mapping paper,

ABSTRACT: Clays of deposits at Levaya Ruba (Vitebskaya Oblast),
Malinovka and Vidibor (Brestskaya Oblast), Shelomy
(Mogilevskaya Oblast), and Yel'niki (Gomel'skaya Oblast)
are used for purifying transformer oil by the contact
method. Clays used for this purpose have an acidity
index from 0.06 to 0.35. The amount of clay required
in the process is 5 to 15 percent of the weight of the
oil. Considerably used transformer oils with an

TITLE: . Pressure Characteristics of a Hydraulic Dredge During Pulp-pumping Operations (O napornoy kharakteristike zemleososa pri rabote na gidrosmesi)

PERIODICAL. Tr. Sredneaz. n.-i. in-ta irrigatsii, 1957, Nr 81, pp 67-71

ABSTRACT. A method is proposed whereby pressure characteristic of a suction dredge employed for pumping of pulp may be derived by means of converting analogous characteristics obtained in tests involving the pumping of water. Preparatory to the conversion, the volumetric weight of the pulp and maximum permissible pumping elevation, determined from conditions of cavitationfree operation, must be expressed as functions of the volumetric discharge rate of material delivered. The converted characteristics show the pressure as a function of the amount of substance delivered under conditions of fluctuating volumetric weight of the pulp and, if plotted, are seen to vary more steeply than the characteristics obtained during pumping of water alone.

ABSTRACT: It has been proven that there is a relationship between the general circulation of the atmosphere and long-term changes in solar activity. However, the tropospheric reaction to solar activity is complex in character. The author attempts to explain the reasons why this relationship is not direct and unambiguous. The following wide range of data were analyzed: mean annual Wolf numbers, indices of the number of well-developed cyclones for three synoptic regions for the period 1900-1940, indices of Atlantic circulation for the same period, mean annual data on atmospheric pressure for the Azores High for the same period and Vangengeym's annual indices of westerly and meridional atmospheric circulation for

TITLE: Investigation of chemical crystallization of germanium in
the open iodide process

SOURCE: Kristallografiya, v. 9, no. 6, 1964, 910-915

TOPIC TAGS: germanium, crystallization, epitaxial growing, single
crystal, thin film

ABSTRACT: To study the epitaxial growths of germanium in the open
iodide process, using the reaction $2 \text{GeI}_2 (\text{gas}) \rightleftharpoons \text{Ge} (\text{solid}) + \text{GeI}_4$
(gas) + Q (calories) the authors investigated the crystallization
of germanium in accordance with this reaction in a vessel consti-
tuting a quartz tube 1 meter long and 18 mm inside diameter and in
a specially constructed oven with programmed heating. The carrier
was a laminar stream of purified hydrogen. Pure iodine was distilled

Card 1/3

L 16580-65
ACCESSION NR: AP5000293

in the hydrogen stream at 70C. The germanium source was finely crushed germanium with specific resistivity ohm-cm. The substrates were single-crystal germanium plates (n type, resistivity 40 ohms-cm), approximately 200 microns thick and with area 0.3 cm^2 . The films produced had equilibrium growth figures (cubic) on the surface, thus indicating that the films are epitaxial, single-crystal, and of high degree of structural perfection. The results show that these figures can be grown in the open iodide process over a wide temperature interval. In the temperature interval 300--400C, the epitaxy of germanium in the iodide process is the rule rather than the exception, with the growth of the film noticeably affected by the purity of the reaction surface of the substrate (no film was grown on contaminated areas). The chemical crystallization method creates growth conditions that are close to equilibrium and yields semiconductor layers with a high degree of structural perfection. In view of the small degrees of supersaturation, it is assumed that the growth of the films in this process is based on a dislocation mechanism. X-ray

TITLE: Study of the thermochemical etching of germanium single crystals with gaseous iodine

SOURCE: Ukrainskiy khimicheskiy zhurnal, v. 32, no. 6, 1966, 642-645

TOPIC TAGS: germanium single crystal, iodine, etched crystal, THERMOCHEMISTRY

ABSTRACT: The article considers the effect of the temperature and pressure of gaseous iodine on the reaction between the latter and single-crystal germanium, and also the mechanism of the thermochemical etching of surface (III) of germanium. It is shown that germanium tetraiodide is formed at 200-550°, and germanium diiodide at 300-800°. The region of maximum yield of diiodide and tetraiodide is ~400°. At T > 600°, the yield of diiodide increases with rising temperature. A mechanism including the successive stages of chemisorption of iodine, formation of the iodide, and desorption is proposed. A metallographic study of the surface after etching showed that true etch figures (flat and depressed triangles) are formed on surface (III) over a definite range of etching rates at 500-600° and iodine pressures of 2-4 mm in the iodine zone. Orig. art. has: 2 figures.

TITLE: Infrared absorption spectrum of single-crystal sodium uranyl acetate

SOURCE: Zhurnal prikladnoy spektroskopii, v. 3, no. 1, 1965, 65-71

TOPIC TAGS: sodium compound, uranium compound, ir spectrum, absorption spectrum, crystal symmetry, acetate

ABSTRACT: The investigated crystals were grown from an aqueous solution by free evaporation. Plane parallel plates measuring 6 x 9 mm and 0.15, 0.075, and 0.032 mm thick were cut from the produced single crystals. The spectra were recorded with an infrared spectrometer (UR-10) in the 400 -- 5000 cm^{-1} range at room temperature. The frequencies of the maxima of the absorption bands are listed and compared with investigations on powdered sodium uranyl acetate (L. H. Jones, J. Chem. Phys. v. 23, 2105, 1955). Although the agreement between

Card 1/2

L 4428-66

ACCESSION NR: AP5018847

3

the values are good, the present results show some singularities in the absorption spectrum of sodium uranyl acetate which were not noted by Jones. These differences are attributed to singularities in the structure of the sodium uranyl acetate crystal and are manifest primarily in a splitting of many clearly pronounced absorption bands into three components. This splitting is explained by means of a group-theoretical analysis. The amount of the splitting is in agreement with that observed earlier in the luminescence spectrum of crystalline sodium uranyl acetate at liquid-hydrogen temperature. The internal vibrations of the complex uranyl triacetate ion in the crystal are shown to split into several components, which are assigned to various symmetry groups. 'The authors thank Academician of AN BSSR A. N. Sevchenko for continuous interest in this research.' Orig. art. has: 3 figures, 2 formulas, and 3 tables.

TITLE: Luminescence spectrum and polarization of crystalline sodium uranyl acetate

SOURCE: Zhurnal prikladnoy spektroskopii. v. 3, no. 2, 1965, 134-141

TOPIC TAGS: luminescence spectrum, single crystal, crystal optic property

ABSTRACT: The authors studied the luminescence spectrum of sodium uranyl acetate single crystals at 77°K. The crystals were grown from an aqueous solution of the salt by free evaporation at room temperature. Specimens with well developed natural faces were selected for the experiments. For studying the luminescence spectra, the crystals were placed in a quartz Dewar flask with transparent walls, filled with liquid nitrogen. It was found that slow cooling of the crystal to -196°C causes no additional imperfections in the structure (cracks, erosion of the surface layer, etc.) which would produce any noticeable changes in the spectrum or polarization of the lines. A DFS-12 double diffraction monochromator with a linear dispersion of 5.2 Å/mm was used for studying the luminescence spectra. The re-

Card 1/4

L 65236-65

ACCESSION NR: AP5021489

ceiver was an FEU-27 photomultiplier cooled by dry ice to -70°C . The light flux was modulated by a frequency of 21 cps with the aid of an electromagnetic vibration light chopper mounted in front of the input slot of the monochromator. The photomultiplier signals were amplified by a U-2-6 amplifier with a passband of 1 cps and then fed to an SD-1 synchrophase detector with a time constant of 2-4 sec. The spectra were recorded on an EPP-09 continuously recording potentiometer. The luminescence in the specimen was excited by emission with a wavelength of 365 mμ from an SVDSH-1000 mercury lamp, passed through a UFS-2 filter and a blue vitriol solution. The luminescence spectrum (see fig. 1 of the Enclosure) is divided into six bands with an average distance of 850 cm^{-1} between homologous lines in neighboring bands. The principle lines (21131, 20278, 19426, 18575, 17726 and 16886 cm^{-1}) are circularly polarized. The degree of polarization is considerably less than 1 (21, 25, 29, 33, 39 and 37% respectively), and increases noticeably toward the red end of the spectrum. The remaining lines of the spectrum are unpolarized. The intensity distribution, frequencies and polarization of the lines are independent of whether the light of various wavelengths which excites the luminescence is linearly or circularly polarized. A DMR-4 double quartz monochromator and a DKSSH-1000 xenon lamp were used for excitation of luminescence on various wavelengths. All lines observed at 77°K are attributed to internal vibrations of the

Card 2/4

L 65236-65

ACCESSION NR: AP5021489

complex $\text{UO}_2(\text{CH}_3\text{COO})_3^-$ ion. It is assumed that the lines could not be due to external vibrations of the crystal lattice, since these should have considerably lower frequencies because of the large masses of the vibrating groups and the relatively small forces of interaction between molecules. It is suggested that the luminescence activity of these crystals is due to complex uranyl triacetate ions which belong to the point group of C_3 symmetry. "In conclusion, the authors are sincerely grateful to Academician AN BSSR A. N. Sevchenko for constant interest in this work." Orig. art. has: 2 figures, 1 table. 44.55

TITLE: Design problems of large scintillation counters with a single photomultiplier

SOURCE: AN SSSR. Izvestiya. Seriya fizicheskaya, v. 29, no. 9, 1965, 1788-1790

TOPIC TAGS: scintillation counter, cosmic ray counter, nuclear scintillation counter

ABSTRACT: Scintillator-photomultiplier mutual arrangement and reflector shape are optimized to decrease the influence of particle trajectory location upon photomultiplier output and to improve reliability of registration of low-density cosmic ray particles. In the experimental arrangement (Fig. 1), a 50 x 50 x 5 cm plastic scintillator occupied only one quadrant of the 100 x 100 cm reflecting container base. A single FEU-44 photomultiplier was used with its axis along the axis of the container. A diffusely reflecting Wattman paper (a high-grade Bristol drafting board) was used as the reflecting surface covering. The location of particle trajectories was determined by a telescope system using SI-56 counters. The area of the scintillator was divided into 16 equal areas 12 x 12 cm, and selections were made of vertical trajectory particle passages within a solid angle of .01 sterad. Arrangement
